

How to configure the Public Wi-Fi Profile

The **Public Wi-Fi Profile** adjusts product settings to give you the possibility to make payments online and use sensitive information in a protected environment. Sending e-mails, typing sensitive credentials, or shopping online while connected to unsafe wireless networks can expose your personal data to risk.

While running in the Public Wi-Fi profile, Bitdefender is set to automatically accomplish the following program settings:

- Advanced Threat Defense is turned on
- The Bitdefender Firewall is turned on, and the following settings are applied to your wireless adapter:
 - Stealth mode-ON
 - Network Type-Public
- The following settings from Online Threat Prevention are turned on:
 - Encrypted web scan
 - Fraud protection
 - Phishing protection

To configure Bitdefender to apply product settings while connected to an unsafe wireless network:

1. Click the **Utilities** icon on the left sidebar of the Bitdefender interface.
2. Click **Settings** in the **Profiles** section.
3. Click the **Configure** button from the Public Wi-Fi Profile area.
4. Let the **Adjusts product settings to boost protection when connected to an unsafe public Wi-Fi network** checkbox enabled.
5. Click **Save** to close the windows.
